Azure VMSS Autoscaling Demo Project

Project Objective
Deploy an Azure Virtual Machine Scale Set (VMSS), configure autoscaling, install Nginx using Cloud-Init, access VMSS instances through SSH, and verify automatic scale-out based on CPU utilization.

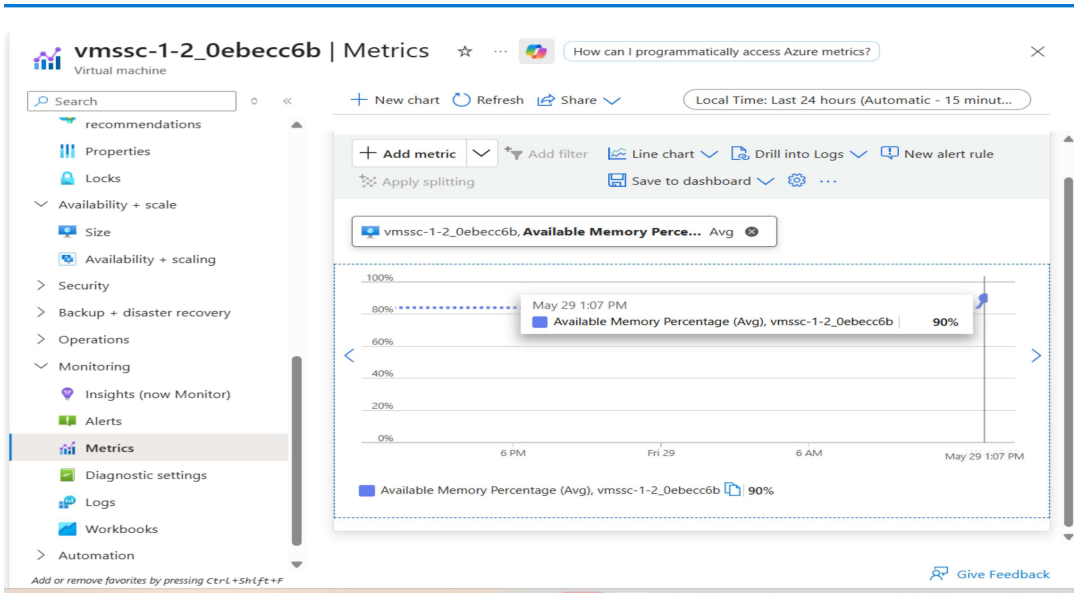

Cloud-Init script used to automatically install and start Nginx on every VMSS instance.

Deployment and Access Flow

1. Created VMSS with initial instance count = 1.
2. Azure automatically created VMSS Instance 0.
3. Configured Azure Load Balancer and Inbound NAT Rule.
4. Connected from local laptop using the SSH command provided by Azure.
5. No separate VM was created; access was directly to the VMSS instance.
6. Verified Nginx installation through browser using the Load Balancer public IP.

Autoscaling Verification

Autoscaling was configured with instance count settings (Min=1, Max=3, Default=1). A CPU stress test was executed inside the VMSS instance. Azure Monitor detected high utilization and automatically created additional VM instances. This demonstrated horizontal scaling and load distribution through the Load Balancer.
